# JavaScript in the Web

# Introductions

- About me...
- - What do you do?
  - What is your programming background?
    - Any front-end?
  - OWhat do you hope to gain from this course?
- OWhat is your current development environment and process?

### How the class works

- Mixture of labs and lecture
- 🔿 Informal
  - Stop me anytime
  - Objective
    Discussion > Lecture
  - Outline is flexible
    - There is too much to cover so we'll adjust as needed
- You'll help define areas of focus
- Class assessment towards the end of the day

# Get the most out of the class

- Ask questions!
- ODo the **labs** (pair up if needed)
- Be punctual
- Avoid distractions
- Master your google-fu
- Play along in the console
- ODon't be afraid to break stuff

# What we'll cover

- Working with the DOM
- Basic Event Handling
- jQuery; Events and the DOM
- jQuery UI introduction
- HTML Form Validation

#### I wasn't planning to cover

- **\***Object Oriented JS
- \*Ajax (incl. in jQuery)
- **\***Core JS concepts
- **∗**ES6 in depth
- \*All the HTML5 APIs

~Mostly for beginner/intermediates~
~You should be familiar with js, html, css~
~let's shape it~

#### Resources

- Reading List
  - https://javascript.info/intro
- ODocumentation
  - http://devdocs.io
  - https://developer.mozilla.org/en-US/docs/Web
  - http://kapeli.com/dash (Mac only)
  - Google it.
- Compatibility checks
  - http://caniuse.com

# Lab prep - set up our toolkit

- A browser with dev tools
  - Preference for Chrome in class
  - ○Open your browser and hit F12 or alt/opt/\\\\\\\-\\\\-\-\\\\-\-\-\-\
- Our web editor, jsfiddle
  - <u>http://jsfiddle.net/</u>
  - Sign up!

Everyone OK with the above?

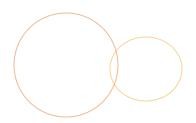

- Sandbox to simulate a full "web page"
  - OHTML + CSS + JavaScript -> Result!
  - The panels are just iframes
- You can specify how to load your javascript
  - noWrap, onLoad, onReady, etc...
  - This will affect if you can access globals from the console
- You can include libraries like jQuery
  - And attach external js files
- When you fork my labs...
  - You immediately own the fork (copy)
  - O You should "update" regularly (save)
  - "Tidy" to clean up your code formatting
  - 6 "Run" to execute all your changes and see the result

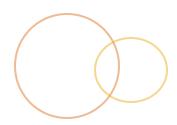

# PDF for today

- On case you didn't quite catch something, or can't see the screen well:
  - Head to my repository
    - <del>(() ###</del>
  - OGo to "/docs" folder
  - Or just download the whole repo...

module

#### **JAVASCRIPT IN THE WEB**

- System of servers that support specially formatted documents
  - You visit a site, it provides a document
  - O Document requests additional resources
- Structured documents with information
  - $\bigcirc$  HTML
  - OCSS
  - …eventually behavior
    - JavaScript

#### History of JavaScript

- "Make webpages alive"
- 1995 Netscape wanted interactivity like HyperCard w/ Java in the name
- ODesigned & built in 10 days by Brendan Eich as "Mocha", released as "LiveScript"
  - OBecame "JavaScript" once name could be licensed from Sun
- O Combines influences from:
  - Java, "Because people like it"

### What is JavaScript?

- Standardized as ECMAScript
- Interpreted
- Case-sensitive C-style syntax
- ODynamically typed (with weak typing)
- Fully dynamic
- Single-threaded event loop
- Ounicode (UTF-16, to be exact)
- OPrototype-based (vs. class-based)
- Kind of weird but enjoyable

## JavaScript Versions

- ©ES3/1.5
  - Released in 1999 in all browsers by 2011
  - IE6-8
- **SES5/1.8** 
  - Released in 2009

  - http://kangax.github.io/compat-table/es5/
- © ES6 [EcmaScript 2015] mostly supported
- ©ES7 [EcmaScript 2016] finalized, but weak support
- ES8 [EcmaScript 2017] finalized in June 2017
- ES.Next...

# JavaScript and the Browser

- Why JavaScript
  - Runs everywhere (on the web)
  - Onteractivity (events)
  - Simple to learn (though hard to master)
  - O Load and manage data in the page
  - The web is the new application platform...
- How it fits
  - OHTML for view data & ui structure
  - CSS for presentation
  - JavaScript for behavior

## Where does JavaScript live?

- Plain text files, not compiled
  - Though this is changing
- Browser (Built-in Engine)
  - Inline <script> blocks
  - Control in the con
- Server (Node)
  - One script file
  - Set of modules

# Languages on JavaScript

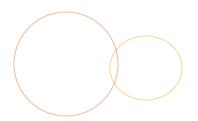

- OJS doesn't always meet everyone's needs
- Transpile (compile) down to plain JavaScript
  - CoffeeScript syntax sugar
  - TypeScript strict data typing
  - ODart non-browser environments
  - ClosureCompiler
  - and more!

## JavaScript and the future

- Continuous co
  - Basic behavior
  - Complex behavior, data fetching/dynamic pages
  - Single Page Applications
  - Full frameworks
  - Servers
  - O Command-line
  - Native applications
- - Compilers
  - Replacing rendering and optimizing HTML

module

#### **DEBUGGING**

# Debugging in the Browser

- Ouse your browser developer tools to access its JavaScript console
- All major browsers are converging to the same API for console
- When in doubt, echo
  - oprint, log, echo, sprintf(), debug(), vardump()
    - Oconsole.log();
- You can code directly in the console
  - shift+enter to break to a new line
  - O Usually shares the same global object/scope
- This is where we'll be working; follow along!

## Browser's Console

- "console" object
  - log
  - odir (lists all properties)
  - oinfo
  - ⊘warn
  - error
  - table(object)
  - ogroup(name); groupEnd();
  - oassert(expr, message); // shows only if false
- Typically on "window", though doesn't always exist
- - http://jsfiddle.net/mrmorris/fp9zgnh9/

# Working with the dev tools

- Inspect and edit HTML
- Inspect and edit CSS
- O View Network happenings, Ajax, etc
- Simulate mobile devices
- OView memory usage/debug issues
- Inspect and debug JavaScript
- Manage/Delete cookies, sessions, data

# Monitor scope and functions

- Set breakpoints
  - Context is a context of the conte
  - O Can set a conditional break-point
    - odebugger;
- Monitor and log all calls to a function
  - monitor(functionName);
- Trigger debugging on a function's call
  - debug(functionName);

## Debugging - Events

- OView Event Listeners registered in the page
  - Event Listeners Panel
  - getEventListeners(document)
- Monitor events on an element
  - monitorEvents(node, eventType);
  - ounmonitorEvents(node);

# Other debugging options

- Snippets
  - Sources > Snippets > New
- Persistence through WorkSpaces
  - <u>https://developers.google.com/web/tools/setup/setup-workflow</u>

refresher

#### **JAVASCRIPT**

- Everyone OK with programming constructs?

  - ofor loops
  - **o** functions
- Everyone OK with Core JS concepts?
  - Coercion
  - Moisting
  - Scope
  - Context
  - Functions
  - Prototype

## Quick Refresher

- There are 5 primitive types (string, number, boolean, null, undefined) and then Objects
  - Functions are a callable Object
  - Objects are property names referencing data
  - Arrays are for sequential data
- Declare variables with "var"
  - Block scope
- Types are coerced
  - Including when a primitive is used like an object
- OAlmost Everything is an object, except the primitives
  - odespite them having object counterparts

### Exercise: Hoisting

OWhat will the output be?

```
function foo() {
  x = 42;
  var x;

console.log(x); // ?
}
```

```
This...
```

```
function foo() {
  x = 42;
  var x;

console.log(x);
}
```

#### Becomes...

```
function foo() {
  var x;
  x = 42;

console.log(x);
}
```

## Exercise: Hoisting

O And this?

```
function foo() {
  console.log(x); // ?
  var x = 42;
}
```

# Solution: Hoisting

#### This...

```
function foo() {
  console.log(x);
  var x = 42;
}
```

#### Becomes...

```
function foo(x) {
  var x;
  console.log(x);
  x = 42;
  return x;
}
```

### Exercise: Variable scope

OWhat is the scope of w, x, y and z?

```
function foo(x) {
    var y = 0;
    if (x === 1) {
         var z = 1;
         w = x;
```

## Exercise: Callbacks & Async

O What does this code do?

```
for (var i = 1; i <= 5; i++) {
    setTimeout(function() {
        console.log(i);
    }, i * 1000);
// logs out?
```

# Solution: Callbacks & Async

```
for (var i = 1; i <= 5; i++) {
    (function(j){
        setTimeout(function()) {
        console.log(i);
      }, i * 1000);
    })(i); // IIFE retain scope
} // outputs: 1, 2, 3, 4, 5</pre>
```

#### Exercise: Objects

What is going on here?

```
var x = {
color: "magenta"
x.name = "Bob";
var y = \{\};
for (var prop in x) {
  if (x.hasOwnProperty(prop)) {
    y[prop] = x[prop];
```

### Exercise: Functions and Context

What is going on here?

```
var x = {color: "magenta"}
var y = {color: "orange"}
var z = function() {
 console.log("My color is", this.color);
x.log = y.log = z;
x.log(); // ?
y.log(); // ?
z(); // ?... for bonus points
```

## Exercise: Warm-up

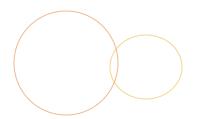

- Getting to know jsfiddle + console
  - Take note of the iframe
- JavaScript Basics

Try to complete as much as possible

Fork: <a href="http://jsfiddle.net/mrmorris/a5v1p5by/">http://jsfiddle.net/mrmorris/a5v1p5by/</a>

refresher

# Wizard check

- OK with basic HTML?
- Can write a page in full?
- Write a <form> and all necessary input controls?
- Ounderstand the difference between <div> and <span>?
- OUnderstand the usage of attributes on elements
- When to use id versus class?

- HyperText Markup Language
- OBrowsers allow support for all sorts of errors html is very error tolerant
- Structure of the UI and "view data"
- Tree of element nodes
- OHTML5
  - Rich feature set
  - Semantic
  - Cross-device compatibility

## Anatomy of a page

```
<!doctype html>
<html lang="en">
    <head>
         <meta charset="utf-8">
         ...document info and includes...
    </head>
    <body>
         <h1>Hello World!</h1>
    </body>
</html>
```

## Anatomy of an element

- <element attributeName="attributeValue">
  Content of element
  - </element>
- Block vs inline

  - </strong></strong>
- Self closing elements
  - <input type="text" name="username" />

# HTML Elements refresher

- Structure

  - - <fieldset>, <label>, <input>, <select>, <textarea>
- Content
  - <h1> through <h6>
- Text modifiers
- A list of elements:
  - <u>https://developer.mozilla.org/en-US/docs/Web/HTML/Element</u>

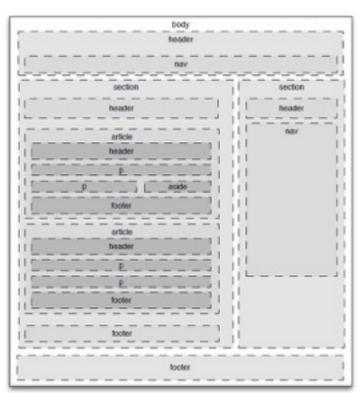

## HTML5 Semantic Elements

- ODesigned to degrade gracefully on non-HTML5 browsers
- ODefine an outline and semantic hints for a document
  - <header>
  - <footer>

  - <section>

  - <figure>, <figcaption>
- - <u>http://jsfiddle.net/mrmorris/L398weeh/</u>

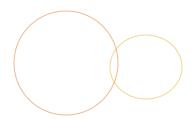

Any questions on HTML?

refresher

CSS

# Wizard check

- OK with basic CSS selectors?
- Style a page in full?
- Select an element using CSS?
- Ounderstand specificity?
- O Got a few special pseudo-selectors under your belt?

## Cascading Style Sheets

- Continuous contraction of the document
  Output
  Description of the document
- Separates presentation from content

```
<!-- external resource -->
<link rel="stylesheet" type="text/css"</pre>
href="theme.css">
<!-- inline block -->
<style type="text/css">
    span {color: red;}
</style>
<!-- inline -->
<span style="color:red">RED</span>
```

## Anatomy of a css declaration

```
    selectors {
    /* declaration block */
    property: value;
    property: value;
    property: val1 val2 val3 val4;

odiv {
    color: #f90;
    border: 1px solid #000;
    padding: 10px;
    margin: 5px 10px 3px 2px;
```

## CSS Selectors

- OBy element
  - 0 h1 {color:#f90;}

<h1></h1>

- By id
  - #header {}

<div id="header"></div>

- OBy class
  - **⊘**.main {}

<div class="main"></div>

- OBy attribute

Odiv[name="user"] {} <div name="user"></div>

- OBy relationship to other elements

op span {}

<span><span></span>

<span><span></span>

## CSS Specificity

- Selectors apply styles based on its specificity
  - inline, id, pseudo-classes, attributes, class, type, universal
- !important allows you to override

```
html:
<div id="main" class="fancy">
     What color will I be?
</div>
css:
#main{
   color: orange;
.fancy{
   color: blue;
#main.fancy{
   color: red;
```

### More CSS Selectors

#### Selector

#id

\*

elementname

.class

element subElement

element:pseudo

element + nextEl

element > child

element ~ sibling

element[attribute]

element[attribute=val]

element:nth-child(i)

:first-child, :last-child

#### Name/Description

Star selector

By id

By element name

By class

By hierarchy

:hover, :checked, etc..

Adjacent sibling

Directly descendant

Any sibling

Has an attribute

Attribute equals

Nth child

Order as child

#### **Example**

\*

#my-id

ul

.my-class-name

div p

a:hover

div + div.special

div > p

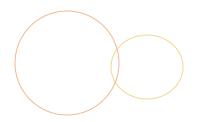

div ~ div

a[title]

input[type=checkbox]

li:nth-child(5)

ul li:first-child

mini-module

# LOADING JS IN THE BROWSER

## Block and inline

- OScript blocks
- Script resources

## Scripts are blocking

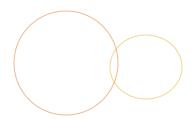

- Browse loads resources top down
- Browser will wait on js+css downloads
- DOM is not parsed until scripts are loaded
- - Defer your <script> load
  - Include at the bottom of </body>
    - It won't block & the DOM is loaded
  - Or leverage the DOMContentLoaded (ie9+) events

### Resource order matters

```
<html>
  <head>
     <!- meta ->
     <!- essential scripts? ->
     <!- essential css/above-the-fold ->
  </head>
 <body>
     <!- all your html ->
     <!- non-essential css ->
     <!- scripts ->
</body>
</html>
```

#### module

#### THE DOM

- Object **M**odel
- What most people hate when they say they hate JavaScript
- The browser's API: interface it provides to JavaScript for manipulating the page
- OBrowser parses HTML and builds a model of the structure, then uses the model to draw it on the screen
- "Live" data structure

# DOM Structure

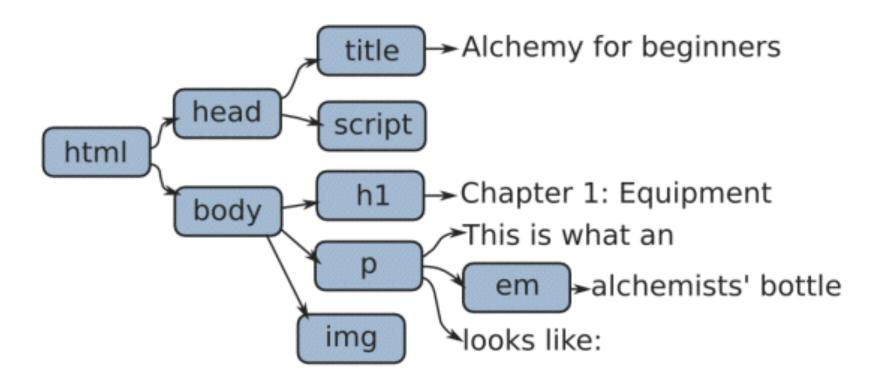

- OGlobal document variable gives us programmatic access to the DOM
- Olt's a tree-like structure
- Each node represents an element in the page, or attribute, or content of an element
- Relationships between nodes allow traversal
- Each DOM node has a nodeType property, which contains a code for the type of element...

## Document Structure

## Document Nodes

HTML like: My text Maps to an object like: childNodes: NodeList[1], id: "name" className: "hi", innerHTML: "My text", id: "name",

OHTML attributes map very loosely to object properties

## Working with the DOM

- O Access the element(s)
  - Select one
  - Select many
  - Traverse
- Work with the element(s)
  - Text
  - O Html
  - Attributes

## Accessing individual elements

Starting at document or a previously selected element

```
O.getElementById("main");
  // returns first element with given id
  // <div id="main">Hi</div>
O.querySelector("p span");
  // returns first matching css selector
  // <span>Me!</span><span>Not!</span>
```

http://jsfiddle.net/mrmorris/wcff257b/

### Accessing element lists

Starting at document or a previously selected element

```
O.getElementsByTagName("a");
// all <a> elements
O.getElementsByClassName("fancy");
// all elements with specified class
// <span class="fancy"></span>
O.querySelectorAll("p span");
// all elements that match the css selector
// </span>Me!</span>Me!</span>
```

## Node Objects

- Single Element
  - HtmlElement
- Inherit properties / interfaces
  - OHtmlElement -> Element -> Node ->
    EventTarget
- Collections
  - OHTMLCollection/NodeList
    - OBrowsers may return one or the other
    - An array-like object containing a collection of DOM elements
    - The query is re-run each time the object is accessed, including the length property

- Nodes can be of different types, we are mostly concerned with element nodes...
  - onElement.nodeType

```
// 1 = Element
```

// 3 = Text node

// 8 = Comment node

// 9 = Document node

## Node Content

- Text node content
  - textNode.nodeValue
- Element node content
  - ○el.textContent
  - ○el.innerText
  - ○el.innerHTML

# Node Attributes

- Accessor methods

  - Oel.setAttribute("title", "Hat");
  - Oel.hasAttribute("title");
  - Oel.removeAttribute("title");
- As properties
  - .href
  - .className

  - .checked

http://jsfiddle.net/mrmorris/duopdjdb/

### Traversal

- Move between nodes via their relationships
- Element node relationship properties
  - 🔿 .parentNode
  - .previousSibling, .nextSibling
  - .firstChild, .lastChild
  - O.childNodes // NodeList
- But... mind the whitespace!

## Modern Element Traversal

- Old traversal methods get tripped up by textnode, line break/whitespace
- New methods avoid that
  - Supported in ie9+
- From an element node
  - .children
  - .firstElementChild, .lastElementChild
  - childElementCount
  - .previousElementSibling
  - $\bigcirc$  .  $\mathtt{nextElementSibling}$

module

#### DOM > CREATION

- 1. Create the container node
  - Insert additional content node(s)
  - Insert text node(s) if working with text
- 2. Determine which pre-existing node you can use to insert the new node
- 3. Insert it into the DOM (append, prepend, insert, replace)

http://jsfiddle.net/mrmorris/ktwdye0w/

### Creating new nodes

- odocument.createElement("div")
  - creates and returns a new node without inserting it into the DOM
- ôdocument.createTextNode("foo bar")
  - ocreates and returns a new text node with given content

### Set element content

- - text content of node and all children
- - html content of node and all children
- - otext, comment, attribute node values
- - form input values

### Adding nodes to the tree

```
// given this set up
var parentEl = document.getElementById("users"),
    existingChild = parentEl.firstElementChild,
    newChild = document.createElement("li");

parentEl.appendChild(newChild);
// appends child to the end of parentEl.childNodes

parentEl.insertBefore(newChild, existingChild);
// inserts newChild in parent.childNodes
// just before the existing child node existingChild
```

# Moving and removing nodes

- - Select and insert will move the element
  - Remove will detach it immediately

```
// given this set up
var parentEl = document.getElementById("users"),
    existingChild = parentEl.firstElementChild,
    newChild = document.createElement("li");

parentEl.replaceChild(newChild, existingChild);
// removes existingChild from parent.childNodes
// and inserts newChild in its place

parentEl.removeChild(existingChild);
// removes existingChild from parentEl.childNodes
```

### Styling elements

- OUse element's "style" property
  - Olt's an object of style properties
    el.style.color = "black";
    el.style.marginLeft = "50px";
- Some style names differ in JavaScript
  - O Hyphens become camelCase
    - obackground-color => backgroundColor
  - Some names were keywords

http://jsfiddle.net/mrmorris/hJwCj/

### ClassList API

- Ability to get, set and toggle classes on element(s)
  - oel.classList.add("class");
  - Oel.classList.remove("class");
  - @el.classList.toggle("class");
  - oel.classList.contains("class")

### DOM Performance

- Interacting with DOM brings up performance issues
  - Searching the tree
  - Accessing a node
  - Iterating over a collection
  - Styling an element (cascades) and other redraws
    - Inserting nodes
    - Cayout changes
    - Accessing css margins
- When dealing with an element, store a reference rather than re-selecting
- When adding nodes, try to reduce the amount of insertions

### DOM basics - Recap

- The DOM is a model of the web page document.
  - It is a standardized convention.
- OBrowsers offer a JavaScript API to interact with the DOM
  - Can affect the page
- You can access, manipulate, create any content within the page
- OjQuery will abstract much of the DOM API implementation nuances away, but it is still a good set of tools to have under your belt
  - Odocument.getElementById()
  - el.querySelector()
  - o el.querySelectorAll()
- Pay attention to DOM performance issues

### Exercises: Dom manipulation

#### 1. Find the Flags

Using your special DOM hunting and walking skills, find the 3 "FLAG" elements in the content and move them to the "#bucket" element

<u>http://jsfiddle.net/mrmorris/97ukrors/</u>

#### 2. Embolden

Make a function, "embolden", that takes an element and makes it appear bold. Write the HTML to test it.

```
function embolden(element) {
    // hint:
    // style it with fontWeight
    // OR wrap it in <strong>
}
```

module

#### **EVENTS**

### Event-driven

- JavaScript engine has an single-threaded, event-driven, asynchronous programming model
  - As things happen
    - OUser clicks
    - Page completes loading
    - Form is submitting
  - Events are fired
    - O Click
    - Coad
    - Submit
  - Which can trigger handler functions that are listening for these events

### So many events...

- O UI
  - Oload, unload, error, resize, scroll
- Keyboard
  - keydown, keyup, keypress
- Mouse
  - Oclick, dblclick, mousedown, mousemove mouseup mouseover, mouseout
- - ofocus, blur
- - oinput, change, submit, reset, select, cut, copy, paste

### Basic Event Handling

- 1. Select an element
  - The element that triggers the event
  - or element that event passes through
- 2. Determine which event you want to listen for
- 3. Define an event handling function to respond to the event when it occurs

O Use the addEventListener method to register a function to be called when an event is triggered ie9+

```
var el = document.getElementById("main");
el.addEventListener("click", function(event) {
    console.log(
        "event triggered on:",
        event.target
    );
}, false); // useCapture default:false
```

### Handler options

- **O**Inline
  - o
- Traditional DOM event handlers
  - oel.onclick = function(){}
- Event listeners (ie9+)
  - Oel.addEventListener(event, function [,
    flow]);
  - Oel.removeEventListener(event, function);
  - Oel.attachEvent(); // ie8- only
- Mandlers are passed an "event" object
  - Oevent object can have different properties depending on the event (ex: "which" for key pressed)
- http://jsfiddle.net/mrmorris/YAnBV/

### Event handler context

Tunctions are called in the context of the DOM element

```
el.addEventListener("click", myHandler);

function myHandler(event) {
   this; // equivalent to el
   event.target; // what triggered the event
   event.currentTarget; // where handler is bound
}
```

# Gotcha: handlers with args

- This won't work like you expect
- element.addEventListener('blur', doSomething(5));
  - - Wrap it in another function

```
el.addEventListener('blur', function() {
    doSomething(5);
});
```

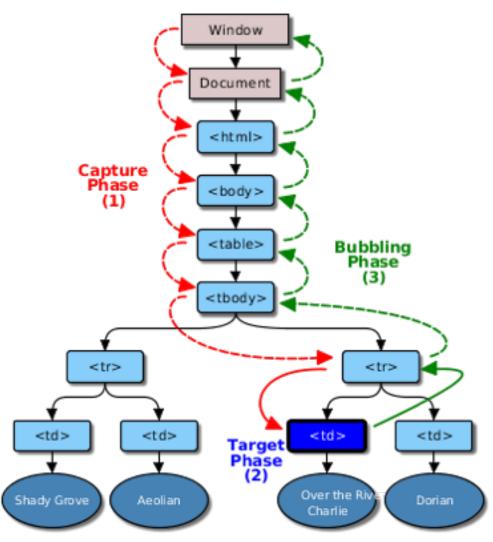

Or use Function.bind()

```
el.addEventListener(
  'blur',
   doSomething.bind(el, 5)
);
```

#### Event Propagation

### Event Propagation

- An event triggered on an element is also triggered on all "ancestor" elements
- Two models
  - Trickling, aka Capturing (Netscape)
  - OBubbling (MS)
- Event handlers can affect propagation

```
// no further propagation
event.stopPropagation();

// no browser default behavior
event.preventDefault();

// no further handlers
event.stopImmediatePropagation();
```

### The event object

- Mandlers are passed event object with lots of info about the event/user
  - Event.screenX
  - Event.screenY
  - © Event.pageX
  - Event.pageY
  - © Event.clientX
  - Event.clientY
- Key events include a "keyCode" property
- http://jsfiddle.net/mrmorris/8htsexcg/

### Complete example

```
var el = document.getElementById('some-id');
el.addEventListener('click', function(event) {
     // "this" represents the element
     // handling the event
     this.style.color: "#ff9900";
     // "target" represents the element
     // that triggered
     event.target.style.color: "#ff9900";
     // you can stop default browser behavior
     event.preventDefault();
     // or you can stop the event from bubbling
     event.stopPropagation();
});
```

### **Event Delegation**

- When a parent element is responsible for handling an event that bubbles up from its children
  - Allows new child content to be added and support the same event
  - Fewer handlers registered, fewer callbacks, reduced chance for memory leaks
- Relies on some event object properties
  - target, which references the originating node of the
     event
  - OcurrentTarget property refers to the element currently handling the event (where the handler is registered)

### Example: Event Delegation

```
document
  .querySelector('ul')
  .addEventListener("click", myLiHandler);
function myLiHandler(event) {
  if (e.target && e.target.nodeName == "LI") {
    console.log(
      e.target.innerHTML, " was clicked!"
    );
```

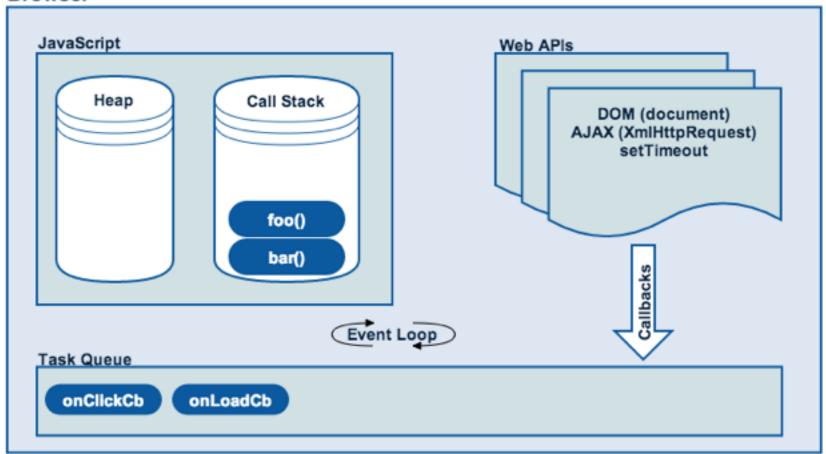

- The true power of JavaScript
- Allows asynchronous operations
  - Methods that get tacked into the queue are 'async'
- Each tick it returns a function from the Queue and runs it to completion (blocking)
  - Avoid blocking scripts...
    - oalert, confirm, prompt, synchronous XHR

#### Browser

### Don't block the event loop

- Although event-loop is "never blocking"
- OJS is still single-threaded
- All functions "run to completion"
  - Included messages in the queue
- For "run later" functionality...
  - **o** callbacks
  - Promises
- For long running tasks...
  - Eteration: break task into multiple turns and call each with a setTimeout
  - WebWorkers: Move the task into a separate process

### Events recap

- Events are notifications that bubble up from different sources in the page
  - OUsually through a user doing something
  - Or some content in the page doing something
- Event delegation allows you to register a single handler to handle many (child) nodes' events
- The browser event loop is powerful but it is single-threaded so a long-running process can halt all interactions in the page.

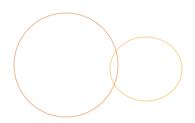

# Exercise - Event Handlers

#### Click Counter

Set up click handlers that count clicks and display information in the page.

https://jsfiddle.net/mrmorris/4e2wravL/

module

**JQUERY** 

- "write less, do more"
- A utility lib that abstracts the ugly parts of the DOM and cross-browser support
  - Selecting elements with css selectors
  - OInteracting with the DOM + content
  - Event handling
- Been around for 10+ years
- O Doesn't do anything pure JavaScript can't do

## jQuery versions

- - Most browser support
- **⊘**2.x
  - ODropped support for ie8
- **⊘**3.x
  - - includes ie8
  - - Modern/leading-edge browsers
  - - Super trim, excludes ajax, effects, deprecated stuff

### jQuery setup

- http://jquery.com/
- Include the script
  - ODownload or CDN
  - https://code.jquery.com/jquery-3.2.1.min.js
- Access the jQuery interface
  - \$("#elementId);
  - jQuery("#elementId");
  - ô\$.each([1,2,3], fn);

#### noConflict

- \$.noConflict();
  - Releases the \$ namespace and restores any previous \$ value

```
jQuery.noConflict();
jQuery("div p").hide();

var j = $.noConflict()();
j("my-id").hide();

// if you loaded two versions of jQuery
// completes releases second version
var v2 = $.noConflict(true);
```

### Getting started with jQuery()

- Select element(s)
  - \$ (document);
- Olt returns a jQuery selection object
  - ovar myDocument = \$(document);
- You can then invoke jQuery methods on the element(s) you selected
  - omyDocument.hide();
- And... you can chain most method invokations
- There are also utility functions that don't depend on an element
  - ♠\$.merge([1,2,3], [4,5,6]);

# Running code when DOM is ready

- These are all equivalent in jQuery
  - \$(handler)
  - \$ (document) .ready(handler)

  - ("img").ready(handler)
  - () .ready(handler)
  - ♦ (document) on ("ready", handler) (deprecated)
- jQuery 3.x recommends:
  - \$ (handler)
- http://jsfiddle.net/mrmorris/y5C3L/

#### selecting in the DOM

- \$(cssSelector);
  - returns a jQuery object, which represents the selection, and is a collection of the matched element(s)
  - Array-like, can access elements as though its an array
- Can set a context to select from

  - contextSelector can be a css selector string, a DOM node or a jQuery object.
- You can include multiple selectors by comma delimiting them within the selection string
  - ♠\$("selector1, selector2")
- The selection is an object reference, not a copy
- Selection is \*not\* cached

## Selecting, some examples

```
6 $("ul", "div#main);
6 $ (".fancy")

    $("li:first")
```

# jQuery (CS\$3) Selectors

- More Examples
  - <u>http://jsfiddle.net/mrmorris/28h69/</u>
- OUse css 3 selectors
  - **⊘** \*

  - ∅#id
  - ♠.class
  - oselector1, selector2 (union)
- Hierarchy
  - oancestor descendent (descendent, ex: "li a")
  - oparent > child (direct child selector)
  - oprevious + next (adjacent sibling)
  - oprevious ~ siblings (sibling selector)

#### Selectors continued

- By content
  - ():contains('text')
  - : empty has no children
  - : has(selector) checks children
  - :not(selector)

#### Child filters

- :nth-child(an+b)
  - (cycle size \* counter + offset)
  - onth-child(2)// second child
  - $\bigcirc$  nth-child(2n+1) => 1, 3, 5...
  - $\bigcirc$  nth-child(3n+2) => 2, 5, 8, 11...
- ○:first-child
- ○:last-child
- :only-child
- for the contract of the c
  - Every nth child of same type

### Finding a specific item by order

Absolute position

first(), last()

- ○:first
- ○:last
- ○: even
- : odd
- Each item in a jQuery object is given a 0-based index number, which can be used to filter the selection

## Finding elements by state

- Attribute filters
  - [attribute] simply has it
  - [attribute='value'] or !=, ^= begins with
- Form filters
  - ○:input

  - ○: checked
- Visibility
  - ♠:hidden
  - ⊘:visible
- State
  - ○:animated

## Explore selectors

- Take a gander, let's get familiar
  - An interactive selector map:
  - http://www.w3schools.com/jquery/trysel.asp
- Browse a site with the inspector
- Take some time
  - Selectors and being able to get the right element(s) is key to mastering jQuery

# Exercise: Selector basics

- Selection Basics
  - Try some basic selection approaches
    - http://jsfiddle.net/mrmorris/5zto6n44/
    - OHint:
      - To style a table row/col with a background, you have to style the cell (td)
- Selection the other way around Describe what is being selected
  - http://jsfiddle.net/mrmorris/7wgvnd8n/

#### Add and filter selections

- You can add and filter elements to or from a jQuery selection
  - \$e1.add(selector);
  - \$el.filter(selector)
    - Filters a selection for sub-set of matching elements within
  - \$el.find(selector)
    - Find descendants of elements in matched collection that match the second selector
    - Similar to \$(selector, context);
  - \$el.not(selector), \$el.has(selector)
    - Similar to :not() and :has() css selectors, but not as performant

- Manipulating your selection
  - http://jsfiddle.net/mrmorris/adx1t106/

## DOM traversal

- Three main traversal types
  - Parents

```
O.parent(), .parents(), .parentsUntil()
```

- 0.closest()
- Children
  - 6.children()
  - find()
- Siblings

```
O.prev(), .prevAll(), .prevUntil()
```

- O.next(), .nextAll(), .nextUntil()
- o.siblings()
- http://jsfiddle.net/mrmorris/3gY46/

### jQuery selection - recap

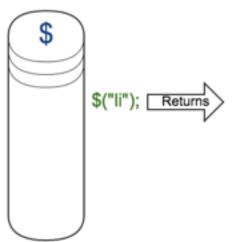

- \$(selector) returns a jQuery selection object
  - 🔿 array-like
    - ♠ \$("li"); // array of li's
  - Element methods can be run directly on it
    - \$("#id").text("goodbye");
  - These can be chained
    - \$("#id").text("goodbye").fadeOut()
  - Implicitly iterates
    - ("li").text("goodbye");
  - O Can store the result and use all jquery element methods
    - ovar items = \$("li");
      items.text("goodbye");

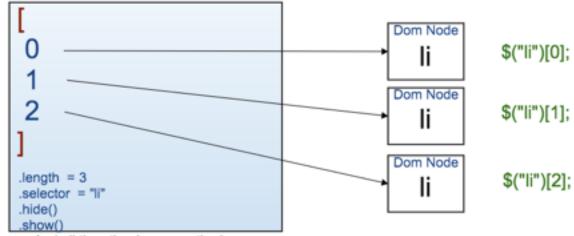

#### the jQuery Object

#### jQuery Selection Object

....And all the other jquery methods

\$("li").hide();

This will iterate over each result (as jquery objects)

# jQuery – selecting native dom node

To access the native DOM element

```
⑤$("#foo")[0];
⑥$("#foo").get(0);
⑥$(".class").get(); // returns array of all
```

## jQuery looping

- \$(selector).each()
  - of for iterating over jQuery element collections

```
() $('li').each(function(i, el){
      // this === the dom node
      $(this).show();
});
```

Implicit iteration for jQuery collections

```
    $('li').html("updated");
```

- \$.each()
  - ofor iterating over an array

### jQuery method chaining

- Typical pattern supported by jQuery
- O Looks like:

```
$("li").css({color: 'red'}).fadeIn();
$("#nav li")
.removeClass('active')
.filter('.fourth')
.addClass('active');
```

How is this done?

# jQuery element manipulation

- ① .text()
  - Returns escaped string
- .html()
- igcolongle .replaceWith()
- remove()
  - O Drops element and all descendants
- .detach()
- o .empty()
  - Removes child nodes
- ounwrap()
  - © Removes parent of matched set, leaving matched elements
- .clone()
  - Oreate and returns copy of element + descendants
  - 6 "true" to include event handlers
- http://jsfiddle.net/mrmorris/dyznkz48/

# jQuery element insertion

- Methods
  - .before()
  - o.after()
  - o.prepend()
  - o.append()
- These guys act a little differently
  - oulder

    oulder<
  - appendTo()
- (before)| (append)

  (before)

  (before)

  (c)

  (c)

  (d)

  (d)</pre

## jQuery element creation

Create the element

```
\bigcirc var newEl = $("<div>Hi</div>");
```

Then Insert

```
    $("body").prepend(newEl);
```

Insertion methods accept an optional callback to perform dynamic insertions

#### Element Attributes

- .attr(attributeName);
   .attr(attributeName, value);
- .removeAttr(attributeName);
- .addClass(classNames);
- .removeClass(classNames);
- ♠ .val()
- isNumeric()
- ô.prop()
  - Object *property*, not necessarily attribute

### Element styling

- ♠ .css() used to retrieve and set css properties
  - ♦('li').css('background-color'); // get
  - ♦ ('li').css('background-color', '#f9f9f9'); // set
- O Can use an object of properties to set multiple

```
$('li").css({
    "padding-left": "+=75",
    "color": "#ff9f9"
});

$('li").css({
    paddingLeft: "+=75",
    color: "#ff9f9"
});
```

## Element styling, continued

jQuery is very generous in its flexibility

```
O.css('background-color', 'red');
.css('backgroundColor', 'red');
.css({
    'background-color': 'red'
});
.css({
    backgroundColor: 'red'
});
```

These will all work just fine

Find the flags, take two Try finding and moving the flag elements again, but this time with jQuery helping us out

http://jsfiddle.net/mrmorris/bkfxf6h2/

module

#### **JQUERY EFFECTS**

# jQuery animation methods

- Some basic functions
  - o.show()

    - show(duration, easing)
    - show(duration, easing, callback)
    - oshow(options)
  - \_ hide()
  - .toggle()
  - .fadeIn()
  - .fadeOut()
  - fadeTo()
  - .fadeToggle()
  - o.slideUp()
  - o.slideDown()
  - .slideToggle()

- animate() for custom effects
  - animate(props, options)
    - Options include duration, easing, queue, step (fn), complete (fn)...
  - O Can animate most *numeric* css properties
    - © Excludes color, background-color, for example
    - OColor can be animated with the jQuery.Color plugin
  - one animate({
     opacity: 0.5
    }[, speed, easing, completeCallback]);

http://jsfiddle.net/mrmorris/Q32FC/

## Sequence of animations

Chain animations to queue them in a sequence

```
$("#el").slideUp('fast').delay(1000).fadeOut('slow');
```

- O Introduce delays mid-queue
  - O.delay(duration)

    - ODoesn't affect no-args show() or hide()
- Can introduce functions to the queue

```
$("#el").animate().animate().queue(function(next){
    // stuff then go to next item in queue
    $(this).dequeue();
    // or.. As of jquery 1.4
    next();
}).animate();
```

## Effects queue

- "fx" is the default
- .stop();
  - OClear the queue
  - .stop(true, true); // clearQueue, jumpToEnd
- .finish()
  - stop animation, remove all queued, complete all animations
- O.queue()
  - OGet queued (array of fns) or manipulate a queue
- O.dequeue()
  - Execute next function in the queue

#### jQuery basics - recap

- Working with jQuery revolves around its built-in selection method
  - ♠\$("selectors")
- Which returns a jQuery object, referencing a collection of DOM elements
- You can invoke methods (chained, if you like) on the result of that method, allowing you to manipulate and get information about the element
  - ("selectors").hide().show().hide();
- Creation of an element is as simple as passing markup to the jQuery method \$("<div></div>");
- Styling is supported, as are some light animations

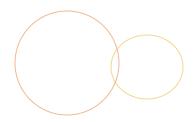

Fruit Basket

Use jQuery to add, replace and move "fruit" elements around the page

http://jsfiddle.net/mrmorris/geq2fyxv/

module

#### **JQUERY EVENT HANDLING**

#### jQuery Event Handling

- http://jsfiddle.net/mrmorris/rzk79p88/
- O.on(eventName, callback);
  - on(eventName, selector, callback);
  - O.on(eventName, selector, data, callback);
- O.off(eventName, callback);
  - O.off(eventName, selector, callback)
  - O.off(eventName, "\*"); // all handlers
- Oone(eventName, callback) {}
  - OCalls the handler only once
  - OSimilar to "on" with "off" within the handler

## Older jQuery Event Handling

- Older versions of jQuery used (pre 1.7)
  - O.click
  - .hover
  - o.submit
- .bind() and .unbind()
  - oare available but on/off is preferred.

# jQuery – Event triggering

- .trigger(eventType [, extraParameters])
  - Trigger the event or eventType on an element
  - Bubbles up the tree
  - ♦ \$("#el").trigger("click");
- .triggerHandler(eventType [, extraParameters])
  - Trigger only the handler
  - Only affects first matched element
  - No bubbling or default browser handling
  - Returns value of last handler executed

# jQuery – Event Delegation

- When you delegate event handling to the parent element
  - OA single parent element will fire for any event from the children
- - Reduces number of event handlers being registered
  - Fewer memory leaks
- ODelegation is \*not\* just a jQuery thing

```
$('ul').on('click', 'li.act', function(e) {
    // executed when the ul descendants
    // match the given selector
    // ie: "When li.act is clicked"
    e.target; // childNode triggering
});
```

http://jsfiddle.net/mrmorris/mn4G9/

### jQuery Event Object

- Passed to event handler functions, lots of data about the event
- Same event methods
  - one in the image of the imag
  - o.stopPropagation()
- Can pass it additional event info

```
$(el).on('click', {customProp: customVal}, hndl);
function hndl(e) {
  console.log(e.data.ryan);
}
```

- Selectors (css)
  - ⊙:button, :checkbox, :checked, :disabled, :enabled, :focus, :text, :file, :image, :input, :password, :radio, :reset, :selected, :submit
  - Not great performers.. So scope on the form element or filter()
- Methods
  - oinputEl.val(), inputEl.prop(), .is(":checked")
- Getting the data
  - ♠\$(form).serialize(); // string
  - \$(form).serializeArray(); // array of objects
- Not all inputs are equal
  - Checkboxes are not present in data when unchecked
  - OUse el.prop('checked') to determine if checked

- Field events
  - oblur, focus
  - change
    - After a field change and field is blurred
  - o input
    - OHTML5; when text input changes
  - select
    - When text in an input is selected
- Form events
  - osubmit, reset
- Return false to prevent actual POST
- http://jsfiddle.net/mrmorris/p2n9G/

### jQuery Custom Events

- Trigger and listen for your own events
  - () \$(el).trigger('topic:label');
  - \$(otherEl).on('topic:label');
- Events propagate normally
- Allows you to focus on target of behavior, rather than the element(s) that trigger it

```
// after user removes last row in table
$tableEl.trigger('grid:empty');

// a site message
$messageEl.on('grid:empty', function() {
    $(this).html('There is no data').fadeIn('slow');
}
```

# Exercise: jQuery Event Handling

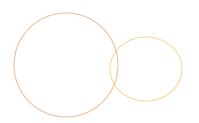

- Click chaser
  [Easy] Basic event handling
  - http://jsfiddle.net/mrmorris/ofh1cz0d/
- Image Grid

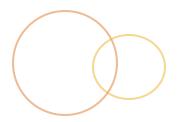

[Interm.] Event handling of a grid of images, including the need to set up delegation

- <u>http://jsfiddle.net/mrmorris/jjomkn54/</u>
- Olssue Tracker

[Adv.] Set up an issue submission form using form events, including some basic validation.

http://jsfiddle.net/mrmorris/tpyhgt42/

module

#### **JQUERY AJAX**

Several ways to do this, but they are all shortcuts of \$.ajax()

```
var jxhr = $.ajax({
    type: string (GET or POST)
    url: string
    data: mixed (converted to query str)
    success: function
    error: function
    complete: function
    timeout: number
    dataType: string (xml, json or html)
    beforeSend: function
}); // returns jQuery xhr object
```

### jQuery – handling the response

- Callbacks (deprecated in jQuery 3.0)
  - obeforeSend, dataFilter, success, error, complete
- or...jQuery XHR implements Promise interface

```
\bigcirc var prom = \$.ajax(\{...\});
```

```
prom.done(function(response){...});
prom.fail(function(){...});
prom.always(function(){...});
prom.then(doneFn, failFn);
```

These promise methods can be chained

```
(in $ .ajax() .done() .fail() .always()
```

### jQuery ajax shorthand

- element.load()
  - O Loads data directly into an element
  - O Can target fragment elements in the response
    - \$('#content').load('bla.html#content');
- $\bigcirc$  \$.get(settings);
- \$.post(settings);
- \$.getJSON(settings);
- \$.getScript(settings);

# jQuery Ajax examples

- More \$.ajax with form post
  - http://jsfiddle.net/mrmorris/pj4e7jxv/
- Example with CORS API
  - http://jsfiddle.net/mrmorris/5vwcx7zp/

#### Promises

- Ajax requests are returning a promise
  - Actually a "jqXHR" object that implements the Promise interface
- Promises have a lifecycle
  - **Ounfulfilled**
  - Fulfilled
  - Failed
- On jQuery, the Promise is based off the \$.Deferred object

# The advantages of a promise

- O You can:
  - oadd multiple success/failure callbacks
  - add callbacks even after the Promise lifecycle is complete
- OUse the behavior of Deferred objects
  - Complete
    Complete
  - Or pipe result data
- The result of an asynchronous operation(s) can be treated as a first class object
- A solution to "callback hell"
  - Think of it like async pathways

## jQuery Ajax review

```
$.ajax({
        type: 'GET', // or 'POST', 'DELETE',
        data: {},
        success: callback
        error: callback
        complete: callback
        dataType: 'json', // 'json', 'html'
});
```

- \$.ajax (and shortcuts) method immediately (synchronously) returns a Promise object
  - ovar prom = \$.ajax({...});
    prom.done(function(response){...});
    prom.fail(function(){...});
    prom.always(function(){...});
- These promise methods can be chained
  - oprom.done().fail().always()

# Anatomy of an Ajax request

```
var prom = $.ajax({
        type: 'GET',
         url: 'http://some.api.com/data.json',
        dataType: 'json',
        data: {}
});
prom.done(function(response, status, prom) {
        // process your response data
});
prom.fail(function(prom, status, error) {
        // handle the error
});
prom.always(function(response, status, error) {
        // wrap up after done or fail
  combined done/error
prom.then(doneCallback, failCallback);
```

### Exercise – jQuery Ajax

- We'll be using this API:
  - http://jsonplaceholder.typicode.com/
  - <u>https://github.com/typicode/jsonplaceholder</u>

#### Photo Grid

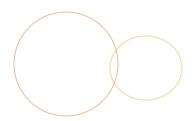

Working together lets complete a dynamic photo grid

- <u>http://jsfiddle.net/mrmorris/Ln8ecynw/</u>
- OHint: Check out the network panel

#### Todo List

Use ajax to load content from an API to build up a todo list

http://jsfiddle.net/mrmorris/1gtqsohv/

module

#### **JQUERY UTILITIES**

- \$.each(array|object, callback(index, val))
  - Olterates and run a callback on each element in array
  - Object enumeration (prop, val)
  - Return "false" to break the loop
- \$.map(array|object, callback)
- \$\int \\$\square\\$\; \rightarray \| \text{object, callback}\; \rightarray \| \text{filter}
- ♠\$(selector).each()
  - o is used exclusively to iterate over a jQuery object

# jQuery Extras

- Accessed through \$/jQuery
  - .trim()
  - isNumeric()
  - ♠ .isArray()
  - o.parseJSON(string)
  - one in the image of the imag
  - one in the image of the imag
  - onerge(firstArray, secondArray)
    - This merges into the first
  - o.extend(target, obj1, obj2)
    - Can set first arg to true for "deep"
- el.data(key, value)
- el.removeData(key)

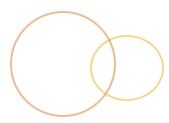

module

#### **JQUERY UI INTRODUCTION**

- http://jqueryui.com/
- "jQuery UI is a curated set of user interface interactions, effects, widgets, and themes built on top of the jQuery JavaScript Library"
  - Accordions
  - 🔿 Date picker
  - 🔿 Tabs, etc...
- Extends jQuery, using jQuery conventions and introducing a few of its own

# Getting set up with jQuery UI

- You must already have jQuery.js included in the page
- Download jqueryui script+css or use a CDN
  - http://jqueryui.com/download/
  - https://code.jquery.com/ui/
- O Customize the package and/or theme
- Include the ui script + theme css in your page

- Accordion
- Autocomplete
- Form widgets:

  - O Datepicker
- Dialog
- Menu
- Progressbar
- Tabs
- 🔿 Tooltip

http://jqueryui.com/accordion/

### Using widgets

- Match the HTML structure
- Initialize on an element
  - \$("#my-element").widgetName();
- Set Options
  - \$("#my-element").widgetName({
     color: "blue",
     times: 5
    });
  - Can pass multiple options objects, which are merged
  - Can override defaults via widgets prototype
    - \$\infty\$ \square \quad\text{\$\cong \quad\text
- OUse Methods
  - Query state or perform actions on the widget
  - \$("#my-element").widgetName("methodName", arg1);

## Widgets examples

- Button and Dialog
  - http://jsfiddle.net/mrmorris/5qvo4zy3/
- Accordion and Tabs
  - http://jsfiddle.net/mrmorris/c89p22ks/
- Form components
  - http://jsfiddle.net/mrmorris/2Lq5fh4z/
- Menus
  - http://jsfiddle.net/mrmorris/gxt2582m/
- 🔿 Tooltips
  - http://jsfiddle.net/mrmorris/z8f5kx6o/

# Widget events

- Widgets trigger events
  - All widgets have a "create" event upon instantiation
  - Can have custom events
  - To handle them
    - OJust bind to the event, in this ex: "something"
      - \$("#my-element").on("wigdetsomething", function() {
         console.log("Hi");
        });
    - or hook into the event callback
      - \$("#my-element").widgetName({
         something: function() {}
        });
- Check the documentation
  - O Dialog Events: <a href="http://api.jqueryui.com/dialog/">http://api.jqueryui.com/dialog/</a>

- Set of mouse-based interactions to add rich interfaces and complex widgets"
- Similar to widgets, they have options, methods and events.
- The interactions:
  - O Draggable
  - Oroppable
  - Resizable
  - Selectable
  - Sortable

## Interactions Examples

- O Drag and Drop
  - http://jsfiddle.net/mrmorris/ko7kxs80/
- Sortable
  - <u>http://jqueryui.com/sortable/</u>
- Selectable
  - <u>http://jqueryui.com/selectable/</u>
- Resizable
  - http://jqueryui.com/resizable/

- Extends jQuery
  - New Effects
  - Better class animation support
- Not all styles can be animated
  - ♠ background-image
- O Color animation is now built-in

#### Animating

- Class animations
  - O.addClass(class, duration, complete)
  - .removeClass(class, duration, complete)
  - .toggleClass(class, duration, complete)
  - switchClass(removeClass, addClass, duration, cb)
  - Specificity matters!
- Display animations
  - hide(effect, options, complete)
  - show(effect, options, complete)
  - .toggle(effect, options, complete)
- These methods are not new, just extended
- http://jsfiddle.net/mrmorris/hyannf0d/

- Some animations will use effects

  - **o** highlight
  - Obounce
- Effects can have options, like "distance" and "times" for the "bounce" effect
- O Can apply an effect directly to an element
  - O.effect(effect, options, duration, complete);

- The easing equation for our animations
- Controls speed of the animation over time
- "linear" is boring
  - "swing" -> jquery default

  - "easeOutQuad"
  - And many more...
- http://api.jqueryui.com/easings/
- http://easings.net/

#### Animating

- Animate specific styles
  - .animate({ color: "green", backgroundColor: "#f90", borderLeftColor: rgb(20, 20, 20) });
- Extends jQuery core .animate to support color animations
- OBetter to just use class-based animations unless specificity is an issue

## Animation method arguments

- .hide
  - (effect [, options] [, duration] [, complete])
  - (options)
    - effect
    - easing
    - Oduration

    - **o** queue
- .addClass
  - (className [, duration] [, easing] [, complete])
  - (className [, options])
    - duration
       duration
    - easing
    - complete
    - children

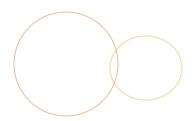

- OHelper to position elements relative to window, document, other elements, or the mouse
  - O// position my center at the center of targetElement
    \$("#element").position({
     my: "center",
     at: "center",
     of: "#targetElement",
     collision: "flip"
    });
  - Positions: "horizontal vertical"
    - OHorizontals: left, center, right
    - O Verticals: top, center, bottom
    - o "right" => "right center"
    - Offsets are ok: "right+10 top-25%"
  - OCollisions: flip, fit, flipfit, none

module

#### FORMS AND VALIDATION

- New form control types
- O Validation options built into HTML

### Form Validation - Constraints

- With HTML5 you get new input types and their input verification
  - ourl, tel, email, number, date, etc...
- New attributes
  - required (binary)
  - pattern (regex or string match)
  - min, max, step, maxlength
  - Form "novalidate" attribute
- O New events

http://jsfiddle.net/mrmorris/zh18vn4x/

# HTML5 Forms continued

- new css pseudo-selectors
  - (a):valid, :invalid, :required, :optional
  - :in-range, :out-of-range
- new element attributes
  - novalidate
  - nequired (
  - opattern, min, max, maxlength, step
- new input types
  - o email

color

🔿 date

o url

o month

🔿 time

number 🔿

search

o week

nange 🔿

o tel

opassword

http://jsfiddle.net/mrmorris/0pekaacb/

- Client-side validation is easy to hack/skip
- Browser's are inconsistent in how they implement
- Error messages can't be customized (w/out js)
- Error messages are tied to user's locale
- Business logic embedded in markup
- oso... you can use the HTML5 Constraint Validation API to programmatically pull it off

### Constrain Validation

- element.setCustomValidity(msg);
- element.validity
  - oa ValidState object

    - patternMismatch
    - 🔿 valid
    - valueMissing
    - willValidate
- element.checkValidity()

# Exercise: JavaScript and the DOM

#### Tabbed UI

Create a tabbed UI that responds to click events and adding new tabs.

http://jsfiddle.net/mrmorris/osq6fed3/

#### 

Create a table-builder function that accepts JSON data and builds a table element with all the trimmings.

http://jsfiddle.net/mrmorris/mnyn3y0t/

the end is hear

#### **WRAPPING UP**

## jQuery/DOM Best Practices

- OAvoid changing the DOM as much as possible
  - But if you have to, use a document fragment or string
  - Check for selection length before manipulating
- Be specific when selecting
  - OUse "context" or "filter"
  - ODon't be over-specific or use the \* selector
- Store your selection(s)
- Prefer native over libs (where it makes sense)
- Name your variables well
  - \$jQuerySelectedThing
- Avoid double wrapping \$(jQueryObjects)

### Going beyond

- Modules
- jQuery toolkits
  - Help with modules
  - Minify and compile
  - Transpile
- - Web Workers
  - Sockets
- OJS in the server
  - NodeJS

- Solve small challenges for kata
  - http://www.codewars.com/
- Code interactively
  - http://www.codecademy.com/
- Share your code and get feedback
